# DESIGN CHOICES

The layout was chosen for its simplicity and ease of deployment and the file structure for its readability and accessibility.

The colors red, white and black were chosen out of personal taste and they rhyme with the jacket worn in the homepage of the site haha.

# JAVASCRIPT FEATURES

1. Tabs
   The experience section of the site utilizes three tabs; skills, experience and education, to give the viewer information about me in an interactive manner.
2. Form Validation
   This is done mainly to ensure that the viewer wanting to contact me submits correct details for successful future communications.
3. Side Menu
   The side menu was added for smaller devices since the navbar's contents were crowding the landing page.

# CHALLENGES

1. Getting the tabs to work was quite a challenge that was easily resolved by correcting previously undetected spelling errors in the JS source file.
2. Deploying with GitHub pages required renaming the home.html file to index.html file in order for the workflow to run correctly.

# DEPLOYMENT PROCESS

1. Create a repository on GitHub and upload your website files there.
2. Go to the repository settings and enable GitHub Pages under the Pages section.
3. Pick the branch and folder to deploy from and save.

4. Go to the actions tab to see the status of your deployment.
